- In recent years, there has been an explosion of interest in many different aspects of single evaporating sessile droplets.
- However, there has been relatively little work on the interactions between **multiple** droplets.
- However, previous experimental and theoretical studies (*e.g.* Lacasta *et al.* 1998, Schäfle *et al.* 1998, Kokalj *et al.* 2010, Sokuler *et al.* 2010, Carrier *et al.* 2016, Castanet *et al.* 2016, Shaikeea *et al.* 2016, Hatte *et al.* 2019, Khilifi *et al.* 2019) and work on closely related problems (*e.g.* Laghezza *et al.* 2016, Michelin *et al.* 2018) have shown the occurrence of shielding due to the presence of other droplets.
- In this talk we describe two different approaches to this problem, exact solutions for one and two thin droplets in two dimensions, and an asymptotic solution for thin droplets in three dimensions.

The Diffusion-Limited Model

• The vapour concentration c satisfies $\nabla^2 c = 0$ subject to $c \to c_{\infty}$ far from the droplet(s),

$$c = c_{sat}$$
 on the droplet(s), and
 $J = -D \frac{\partial c}{\partial n} = 0$ on the substrate.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

The Diffusion-Limited Model

• The vapour concentration c satisfies $\nabla^2 c = 0$ subject to $c \to c_{\infty}$ far from the droplet(s),

$$c=c_{
m sat}$$
 on the droplet(s), and $J=-Drac{\partial c}{\partial n}=0$ on the substrate

 Assuming that the droplet(s) are sufficiently small, they have quasi-static profile

$$\frac{\theta}{2}(R^2 - x^2)$$
 with area $\frac{2\theta R^2}{3}$ in two dimensions, and $\frac{\theta}{2}(R^2 - r^2)$ with volume $\frac{\pi \theta R^3}{4}$ in three dimensions.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

The Diffusion-Limited Model

• The vapour concentration c satisfies $abla^2 c = 0$ subject to $c o c_\infty$ far from the droplet(s),

$$c = c_{sat}$$
 on the droplet(s), and ∂c

$$J = -D\frac{\partial c}{\partial n} = 0$$
 on the substrate.

• Assuming that the droplet(s) are sufficiently small, they have quasi-static profile

$$\frac{\theta}{2}(R^2 - x^2)$$
 with area $\frac{2\theta R^2}{3}$ in two dimensions, and $\frac{\theta}{2}(R^2 - r^2)$ with volume $\frac{\pi \theta R^3}{4}$ in three dimensions.

• The evolution of the droplet(s) satisfies

$$rac{\mathrm{d}}{\mathrm{d}t}(ext{area or volume of droplet}) = -rac{1}{
ho}\int_{ ext{surface area}} J \,\mathrm{d}S.$$

Part 1:

Exact solutions for one and two thin droplets in two dimensions

Schofield, Wray, Pritchard and Wilson, "The shielding effect extends the lifetimes of two-dimensional sessile droplets", to appear in *J. Eng. Math.* (2020)

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

The work of Sneddon (1966) shows that, unlike in three dimensions, there is no solution satisfying the far-field condition c → 0 as x² + y² → ∞.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- The work of Sneddon (1966) shows that, unlike in three dimensions, there is no solution satisfying the far-field condition c → 0 as x² + y² → ∞.
- We therefore relax the problem slightly and impose the condition c = 0 at a large but finite boundary.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- The work of Sneddon (1966) shows that, unlike in three dimensions, there is no solution satisfying the far-field condition c → 0 as x² + y² → ∞.
- We therefore relax the problem slightly and impose the condition c = 0 at a **large but finite boundary**.
- We solve the problem numerically in a semi-circular domain, and analytically using complex-variable theory in a semi-elliptical domain.

Exact Solution of the One-Droplet Problem

The exact solution in the semi-ellipse is

$$c(x,y) = 1 - \frac{1}{\operatorname{arcsinh}(\Psi/R)} \Im\left[\operatorname{arccos}\left(-\frac{z}{R}\right)\right],$$

and hence

$$J(x) = -\frac{\partial c}{\partial y}(x,0) = \frac{1}{\operatorname{arcsinh}(\Psi/R)} \frac{1}{\sqrt{R^2 - x^2}} \quad \text{for} \quad |x| < R.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Numerical Validation

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

• The evolution, and hence the lifetime, of the droplet depends on the **mode of evaporation**.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- The evolution, and hence the lifetime, of the droplet depends on the **mode of evaporation**.
- We consider constant radius (CR), constant angle (CA), and slick-slide (SS) modes.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Constant Radius (CR) Mode

$$R(t) \equiv 1, \quad \theta(t) = 1 - \frac{3\pi}{2 \operatorname{arcsinh}\Psi}t, \quad A(t) = \frac{2}{3} \left[1 - \frac{3\pi}{2 \operatorname{arcsinh}\Psi}t\right]$$

Lifetime of droplet

$$t_{\rm CR} = \frac{2}{3\pi} \operatorname{arcsinh} \Psi$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Constant Angle (CA) Mode

$$t = \frac{2}{3\pi} \left[\operatorname{arcsinh} \Psi - R^2(t) \operatorname{arcsinh} \left(\frac{\Psi}{R(t)} \right) \right]$$
$$+ \Psi \left(\sqrt{\Psi^2 + 1} - \sqrt{\Psi^2 + R^2(t)} \right),$$
$$\theta(t) \equiv 1, \quad A(t) = \frac{2R^2(t)}{3}$$

Lifetime of droplet

$$t_{\mathsf{CA}} = \frac{2}{3\pi} \left[\mathsf{arcsinh} \Psi + \Psi \left(\sqrt{\Psi^2 + 1} - \Psi \right) \right]$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ○ □ ○ ○ ○ ○

CR and CA Modes

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Stick-Slide (SS) Mode

In the pinned phase $0 < t < t^*$ droplet is in the CR mode,

$$t^* = rac{2(1- heta^*) \mathrm{arcsinh} \Psi}{3\pi},$$

while in the slide phase $t^* < t < t_{SS}$,

$$t = t^* + rac{2 heta^*}{3\pi} \left[\operatorname{arcsinh} \Psi - R^2(t) \operatorname{arcsinh} \left(rac{\Psi}{R(t)}
ight)
ight.
onumber \ + \Psi \left(\sqrt{\Psi^2 + 1} - \sqrt{\Psi^2 + R^2(t)}
ight)
ight].$$

Lifetime of droplet

$$t_{\text{SS}} = rac{2}{3\pi} \left[\operatorname{arcsinh} \Psi + heta^* \Psi \left(\sqrt{\Psi^2 + 1} - \Psi
ight)
ight]$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

SS Mode

Asymptotic Limit of a Large Domain, $\Psi \gg R$

$$t_{CR} = \frac{2}{3\pi} \ln(2\Psi) + O\left(\frac{1}{\Psi^2}\right)$$
$$t_{CA} = \frac{2}{3\pi} \ln(2\Psi) + \frac{1}{3\pi} + O\left(\frac{1}{\Psi^2}\right)$$
$$t_{SS} = \frac{2}{3\pi} \ln(2\Psi) + \frac{\theta^*}{3\pi} + O\left(\frac{1}{\Psi^2}\right)$$

Exact Solution of the Two-Droplet Problem

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

Exact Solution of the Two-Droplet Problem

The exact solution is

$$c(\eta,\xi) = 1 - \frac{1}{\operatorname{arcsinh}\left(\Psi/\sqrt{\Omega^2 - I^2}\right)} \Im\left[\operatorname{arccos}\left(-\sqrt{\frac{\zeta^2 - I^2}{\Omega^2 - I^2}}\right)\right],$$

and hence

$$J(\eta) = -rac{\partial c}{\partial \xi}(\eta, 0) = rac{1}{rcsinh\left(\Psi/\sqrt{\Omega^2 - I^2}
ight)}rac{\eta}{\sqrt{\Omega^2 - \eta^2}\sqrt{\eta^2 - I^2}}.$$

Part 2:

An asymptotic solution for thin droplets in three dimensions

Wray, Duffy and Wilson, "Competitive evaporation of multiple sessile droplets", to appear in *J. Fluid Mech.* (2020)

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Formulation

Consider N thin droplets on the substrate z = 0 whose surfaces S_k have radii a_k and centres (x_k, y_k) for k = 1, 2, ..., N with local fluxes J_k and integral fluxes F_k .

ヘロト 人間 ト 人 ヨト 人 ヨト

э

Solution

Using a series of integral transformations, Fabrikant (1985) showed that

$$J_{k} = J_{0} \left[1 - \frac{1}{2\pi} \sum_{\substack{n=1, \\ n \neq k}}^{N} \iint_{S_{n}} \frac{\sqrt{\rho'^{2} - a_{k}^{2}} J_{n}(\rho', \phi') \rho' d\rho' d\phi'}{\rho^{2} + \rho'^{2} - 2\rho\rho' \cos(\phi - \phi')} \right]$$

for k = 1, 2, ..., N, where

$$J_0 = \frac{2}{\pi\sqrt{a_k^2 - \rho^2}}$$

is the flux from the k^{th} droplet in isolation.

The integral flux from the k^{th} droplet (i.e. the integral of J_k over S_k), denoted by

$$F_k = \iint_{S_k} J_k(\rho, \phi) \,\rho \,\mathrm{d}\rho \,\mathrm{d}\phi,$$

is given by

$$F_{k} = 4a_{k} - \frac{2}{\pi} \sum_{\substack{n=1, \\ n \neq k}}^{N} \iint_{S_{n}} J_{n}\left(\rho', \phi'\right) \arcsin\left(\frac{a_{k}}{\rho'}\right) \rho' d\rho' d\phi'$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

for k = 1, 2, ..., N.

• Our goal is to derive explicit expressions for the fluxes J_k in the asymptotic limit of well-separated droplets.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- Our goal is to derive explicit expressions for the fluxes *J_k* in the asymptotic limit of well-separated droplets.
- If the radius of each droplet a_k is small relative to the distance between the centre of that droplet and any other than

$$F_k = 4a_k - \frac{2}{\pi} \sum_{\substack{n=1, \\ n \neq k}}^N F_n \arcsin\left(\frac{a_k}{r_{k,n}}\right) \quad \text{for} \quad k = 1, 2, \dots, N.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Our goal is to derive explicit expressions for the fluxes *J_k* in the asymptotic limit of well-separated droplets.
- If the radius of each droplet ak is small relative to the distance between the centre of that droplet and any other than

$$F_k = 4a_k - \frac{2}{\pi} \sum_{\substack{n=1, \\ n \neq k}}^{N} F_n \arcsin\left(\frac{a_k}{r_{k,n}}\right) \quad \text{for} \quad k = 1, 2, \dots, N.$$

• This is a set of *N* linear algebraic equations for the *F_k* which may be solved exactly for any given configuration of droplets.

• Similarly,

$$J_{k} = J_{0} \left[1 - \frac{1}{2\pi} \sum_{\substack{n=1, \ n \neq k}}^{N} \frac{F_{n} \sqrt{r_{k,n}^{2} - a_{k}^{2}}}{\rho^{2} + r_{k,n}^{2} - 2\rho r_{k,n} \cos(\phi - \psi_{k,n})} \right]$$

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

for
$$k = 1, 2, ..., N$$
.

• Similarly,

$$J_{k} = J_{0} \left[1 - \frac{1}{2\pi} \sum_{\substack{n=1, \ n \neq k}}^{N} \frac{F_{n} \sqrt{r_{k,n}^{2} - a_{k}^{2}}}{\rho^{2} + r_{k,n}^{2} - 2\rho r_{k,n} \cos(\phi - \psi_{k,n})} \right]$$

for k = 1, 2, ..., N.

• With the integral fluxes F_k determined, this gives the fluxes J_k explicitly.

• Similarly,

$$J_{k} = J_{0} \left[1 - \frac{1}{2\pi} \sum_{\substack{n=1, \ n \neq k}}^{N} \frac{F_{n} \sqrt{r_{k,n}^{2} - a_{k}^{2}}}{\rho^{2} + r_{k,n}^{2} - 2\rho r_{k,n} \cos(\phi - \psi_{k,n})} \right]$$

for k = 1, 2, ..., N.

- With the integral fluxes F_k determined, this gives the fluxes J_k explicitly.
- We now analyse one particular configuration, namely a pair of identical droplets.

A Pair of Identical Droplets

• Consider a pair of identical droplets with the same radii $a_1 = a_2 = a$ and centres a distance b(> 2a) apart located at (-b/2, 0) and (b/2, 0).

A Pair of Identical Droplets

- Consider a pair of identical droplets with the same radii $a_1 = a_2 = a$ and centres a distance b(> 2a) apart located at (-b/2, 0) and (b/2, 0).
- The droplets have the same integral flux $F_1 = F_2 = F$ given by

$$F = \frac{4a}{1 + \frac{2}{\pi}\arcsin\frac{a}{b}}$$

A Pair of Identical Droplets

- Consider a pair of identical droplets with the same radii $a_1 = a_2 = a$ and centres a distance b(> 2a) apart located at (-b/2, 0) and (b/2, 0).
- The droplets have the same integral flux $F_1 = F_2 = F$ given by

$$F = \frac{4a}{1 + \frac{2}{\pi}\arcsin\frac{a}{b}}$$

• The flux from the droplet centred at (-b/2,0) is

$$J_{1} = J_{0} \left[1 - \frac{F\sqrt{b^{2} - a^{2}}}{2\pi \left(\rho^{2} + b^{2} - 2\rho b \cos \phi\right)} \right],$$

with a corresponding expression for the other droplet.

Evolutions and Lifetimes

Scale and non-dimensionalise according to

$$heta_k = heta_{
m ref} \hat{ heta}_k, \quad h_k = a_{
m ref} heta_{
m ref} \hat{h}_k, \quad V_k = a_{
m ref}^3 heta_{
m ref} \hat{V}_k, \quad t = rac{
ho_{
m fluid} a_{
m ref}^2 heta_{
m ref}}{D\left(c_{
m sat} - c_\infty
ight)} \hat{t}.$$

For sufficiently small droplets

$$h_k = \frac{a_k \theta_k}{2} \left(1 - \frac{\rho^2}{a_k^2} \right), \quad V_k = 2\pi \int_0^{a_k} h_k \rho \,\mathrm{d}\rho = \frac{\pi a_k^3 \theta_k}{4}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Evolutions and Lifetimes

Evolution of $a_k = a_k(t)$ and/or $\theta_k = \theta_k(t)$ and $V_k = V_k(t)$ satisfies

$$\frac{\mathrm{d}}{\mathrm{d}t}\left(a_{k}^{3}\theta_{k}\right)=-\frac{4F_{k}}{\pi}$$

For a pair of identical droplets with radii a = a(t), contact angle $\theta = \theta(t)$ and volume V = V(t) this gives

$$\frac{\mathrm{d}}{\mathrm{d}t}\left(a^{3}\theta\right) = -\frac{16a}{\pi\left(1 + \frac{2}{\pi}\arcsin\frac{a}{b}\right)}$$

Constant Radius (CR) Mode

Setting $a \equiv \bar{a}$ gives

$$\frac{\mathrm{d}\theta}{\mathrm{d}t} = -\frac{16}{\pi \bar{a}^2 \left(1 + \frac{2}{\pi} \arcsin \frac{\bar{a}}{\bar{b}}\right)},$$

and hence

$$\theta = \bar{\theta} - \frac{16t}{\pi \bar{a}^2 \left(1 + \frac{2}{\pi} \arcsin \frac{\bar{a}}{b}\right)}, \quad V = \frac{\pi \bar{a}^3 \bar{\theta}}{4} - \frac{4 \bar{a} t}{1 + \frac{2}{\pi} \arcsin \frac{\bar{a}}{b}}.$$

In particular, the lifetime of the droplets in the CR mode is

$$t_{\mathsf{CR}} = t_{\mathsf{CR}_{\infty}} \left(1 + \frac{2}{\pi} \arcsin \frac{\bar{a}}{b} \right),$$

where $t_{CR\infty} = \pi \bar{a}^2 \bar{\theta}/16$ is the lifetime of the droplets in isolation.

Constant Angle (CA) Mode

Setting $\boldsymbol{\theta} \equiv \bar{\boldsymbol{\theta}}$ gives

$$\frac{\mathrm{d}a}{\mathrm{d}t} = -\frac{16}{3\pi a\bar{\theta} \left(1 + \frac{2}{\pi} \arcsin \frac{a}{b}\right)},$$

and hence $V = \pi a^3 \bar{\theta}/4$ and

$$t = \frac{3\pi\bar{\theta}}{32} \left[\hat{a}^2 + \frac{1}{\pi} \left\{ \hat{a}\sqrt{b^2 - \hat{a}^2} - \left(b^2 - 2\hat{a}^2\right) \arcsin\frac{\hat{a}}{b} \right\} \right]_{\hat{a}=a}^{\hat{a}=\bar{a}}$$

In particular, the lifetime of the droplets in the CA mode is

$$t_{\mathsf{CA}} = t_{\mathsf{CA}_{\infty}} \left[1 + \frac{1}{\pi} \left\{ \sqrt{\frac{b^2}{\bar{a}^2} - 1} - \left(\frac{b^2}{\bar{a}^2} - 2 \right) \arcsin \frac{\bar{a}}{b} \right\} \right],$$

where $t_{CA_{\infty}} = 3\pi \bar{a}^2 \bar{\theta}/32$ is the lifetime of droplets in isolation.

Stick-Slide (SS) Mode

A CR phase with $a \equiv \bar{a}$ is followed by a CA phase with $\theta \equiv \theta^{\star}$.

In particular, the lifetime of the droplets in the SS mode is

$$t_{\text{SS}} = \left[1 + \frac{\left(2\bar{a}^2\left(2\bar{\theta} + \theta^{\star}\right) - 3b^2\theta^{\star}\right) \arcsin(\bar{a}/b) + 3\bar{a}\theta^{\star}\sqrt{b^2 - \bar{a}^2}}{\pi\bar{a}^2\left(2\bar{\theta} + \theta^{\star}\right)}\right] t_{\text{SS}_{\infty}},$$

where $t_{SS\infty} = \pi \bar{a}^2 (2\bar{\theta} + \theta^*)/32$ is the lifetime of droplets in isolation.
Droplet Lifetimes

Lifetimes of a pair of droplets evaporating in the CR, CA and SS modes.

Radially Integrated Flux

The radially integrated flux from the k^{th} droplet is given by

$$R_k = \int_0^{a_k} J_k(\rho, \phi) \,\rho \,\mathrm{d}\rho,$$

and for a pair of identical droplets

$$R_1 = R_0 \left[1 - \frac{F\sqrt{1-k^2}}{2\pi a \sin \phi} \mathcal{I} \left\{ \frac{\log \left[-\left(k e^{-i\phi} + \sqrt{k^2 e^{-2i\phi} - 1}\right)\right]}{\sqrt{k^2 e^{-2i\phi} - 1}} \right\} \right],$$

where k = a/b and $R_0 = 2a/\pi$ is the radially integrated flux from an isolated droplet.

Radially Integrated Flux

Exact (solid) and approximate (dashed) radially integrated flux.

The Coffee-Ring Effect

• Saenz *et al.* (2017) showed that for a droplet containing nanoparticles evaporating in the CR mode, the distribution of the final residue is strongly related to the radially integrated evaporative flux R_k .

The Coffee-Ring Effect

- Saenz *et al.* (2017) showed that for a droplet containing nanoparticles evaporating in the CR mode, the distribution of the final residue is strongly related to the radially integrated evaporative flux R_k .
- In particular, the radial directions with the greatest values of *R_k* have the greatest fluid flux within the droplet, giving the greatest concentration of residue at the contact line.

The Coffee-Ring Effect

- Saenz *et al.* (2017) showed that for a droplet containing nanoparticles evaporating in the CR mode, the distribution of the final residue is strongly related to the radially integrated evaporative flux R_k .
- In particular, the radial directions with the greatest values of *R_k* have the greatest fluid flux within the droplet, giving the greatest concentration of residue at the contact line.
- Hence, a pair of identical droplets will give rise to **non-homogeneous coffee-rings**, with least residue where the contact lines are closest together and most residue where they are furthest apart.
